1. About This Document

This document describes the hardware design spec of the project **SOM-AM57XX.**
.Reference documents are listed below:

- AM572x Sitara Processors Silicon Revision 2.0 (Rev. B)
- AM572x AM571x-Compatibility Guide
- AM572x Technical Reference Manual
- AM572x Power Consumption Summary
- AM57XX ,Transformer SoM Family - AM57x MRD 201704

2. Introduction

2.1. Target Components :

For the SOM board can work at -40°C ~+85°C,all the components used should meet the requirement.

CPU:	AM5728	New
PMIC:	TPS6590377ZWSR	New
DDR:	MT41K256M16TW-107 IT	Library
QSPI FLASH:	S25FL256SRS232	Library
EMMC:	EMMC08G-M325	New
Clock Generator:	CDCM9102RHBR	New
DC/DC	TPS51200	New
DC/DC	TPS22965	New
Logic	SN74LVC1G08	New
Crystal	5YAA22579182TF60Q3	New
Crystal	5YAA20000181TF70Q3	New
Crystal	5YAA16384102TF60Q3	New

2.2. List of Abbreviations:

XIP	- Execute in place
MCASP	- Multichannel audio serial port
SOM	- System On Module
GPMC	- General Purpose Memory Controller
MTBF	- Mean Time Between Failure
BTB	- Board To Board
IC	- Integrated Circuit
PD	- Pull Down
PU	- Pull Up
EMIF	- External Memory Interface

2.3. Principle of Hareware design

2.3.1. Hardware stability

- The logic level of a logic circuit must guarantee a level of magnitude (high or low), and the float pins of the chip must be setted to a low or high level.

- Power ripple: the power ripple of the core voltage should within the requirement .
- For the PCB design of high-speed signals,the special repedance,time delay and other requirements of PCB wiring should be guaranteed .
- The clocks devices should choose the devices with good stability and temperature characteristics.
- The circuit design needs to consider EMI suppression, EMI/EMC experiments need to do, and the relevant requirements need to meet.

2.3.2. Reliability requirements

- Structural reliability: PCB layout should be reasonable, the proper connectors should be selected, and ensure that is easy to production and maintenance .
- Reliability of the circuit: The material quality, capacitor quality, clock quality and so on should be considered to ensure that the system can work steadily for a long time.
- MTBF:20000 hours.

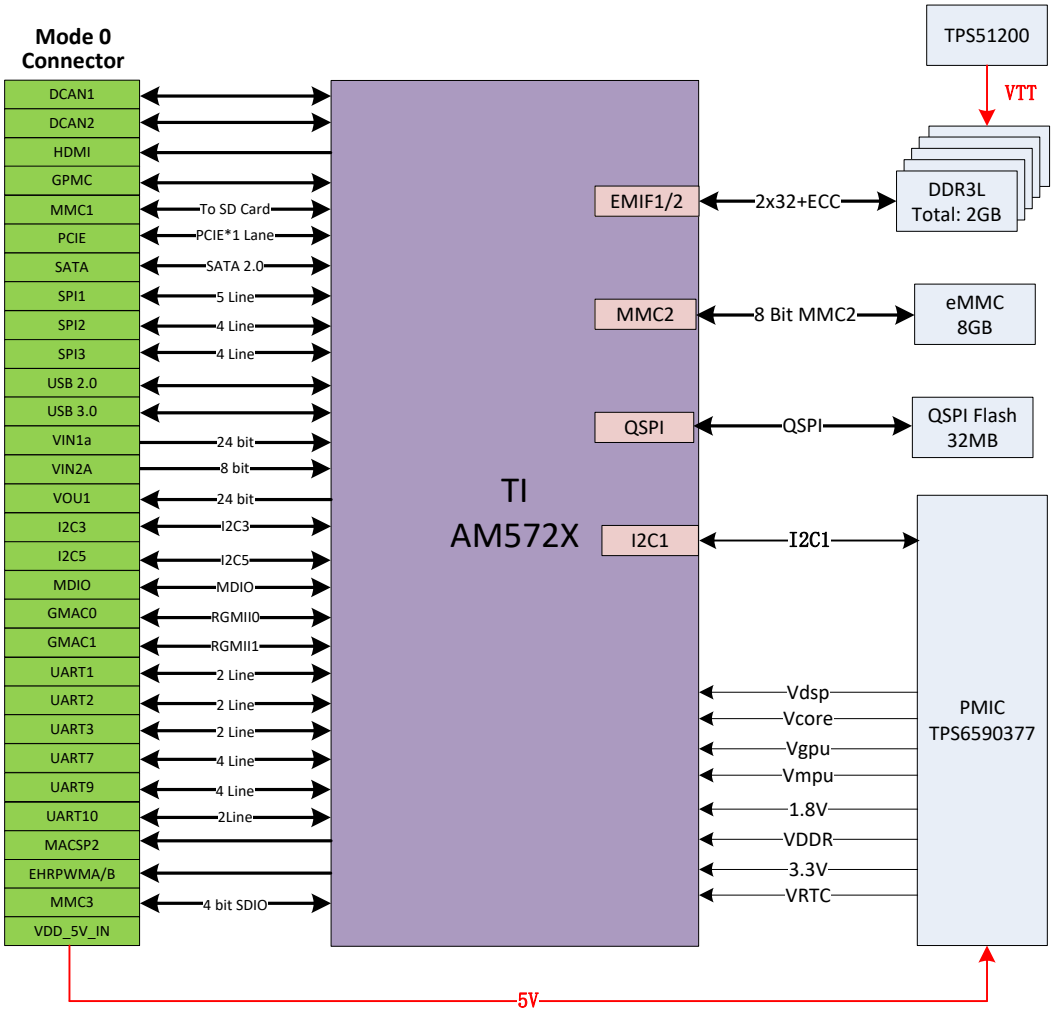
2.3.3. Hardware fault testability

- According to the function module distribution, each module should set the appropriate test points.

3. Platform Architecture

3.1. Block Diagram

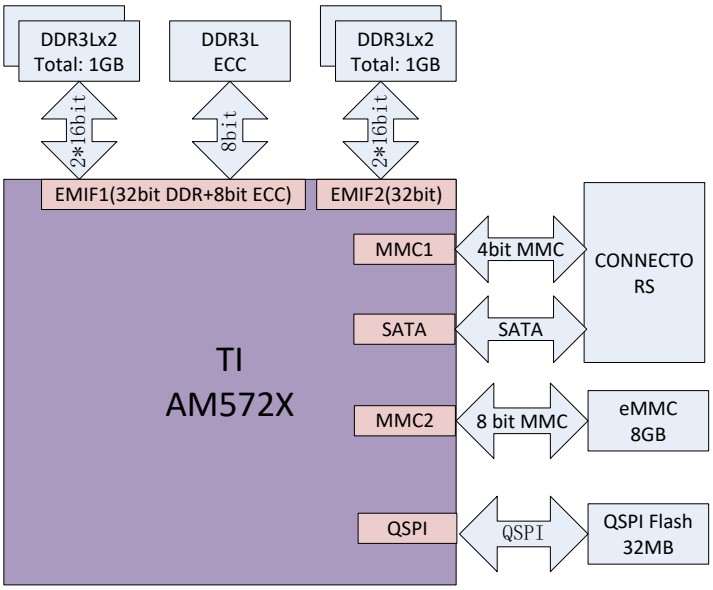
SOM-AM57xx-TM BLOCK Diagram



3.2. Hardware signal design

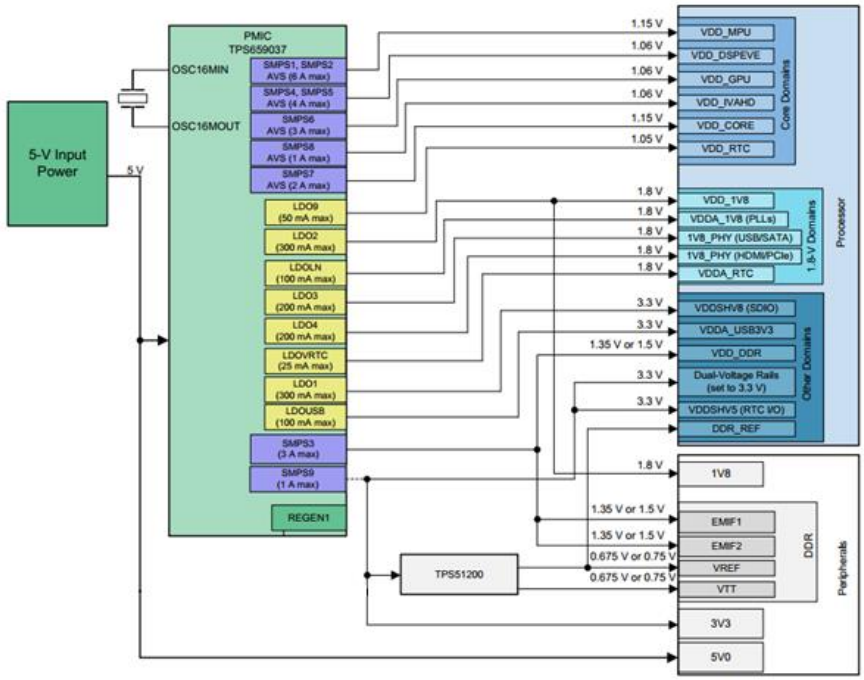
3.2.1. Storage Design

The SOM board takes RAM+ROM mode.
For the ROM, 8GB eMMC and 32MB QSPI flash are used.
SATA, MMC interfaces are connected to the connectors.
For the RAM, 4pcs 16x32MB DD3Ls are used because of the high price of 1GB DD3L.
A 16x32MB DDR3L used for ECC is connected to EMIF1.
The storage architecture as below:



3.2.2. Power Design

+5V/2A power supply is provided by the base board to supply the PMIC.
The PMIC provides all the power of AM5728.
The PMIC can control the power sequence of the AM5728 to meet the spec.
The AM5728 can communicate with PMIC with I2C1 interface and control the PMIC power output.
The PMIC can work when power on, and then the PMIC can be power off by the signal
The power architecture as below:



Power Consumption

Power Supply Group	Voltage [V]	Current [mA] [max]
VDD_CORE	1.00	747.7
VDD_MPU	1.20	3307.8
VDD_DSP	1.06	342.5
VDD_IVA	1.12	54.8

VDD_GPU	1.09	795.8
VDDS_DDR	1.35	366.9
Analog PHY	1.78	103.1
Analog DPLL	1.79	37.1
Analog USB PHY	3.30	3.5
1.8V IO	1.81	138.3
3.3V IO	3.27	80.3
VDD_DDR	1.34	528.5

The power on sequence as below:

Boot[15:6] need to be setted on the SOM board ,no need to reconfigurated on the base board.
Boot[5:0] need to pull high on the SOM board ,the base board can reconfigurate to set the work mode of AM5728.
Boot[15:0] default configuration is 1000000100111111 .

Boot Peripheral Pin Multiplexing

According to selected boot peripheral, the pin multiplexing configuration is coded by ROM code These settings are not restored to default values at ROM code exit.

Table 33-10. Pin Multiplexing According to Boot Peripheral

Boot Device	Boot Interface	Pads	MuxMode	Signals
eMMC	MMC2	gpmc_a[19:27], gpmc_cs[1]	MuxMode=0x1	mmc2_dat[4:7], mmc2_clk, mmc2_dat[0:3], mmc2_cmd

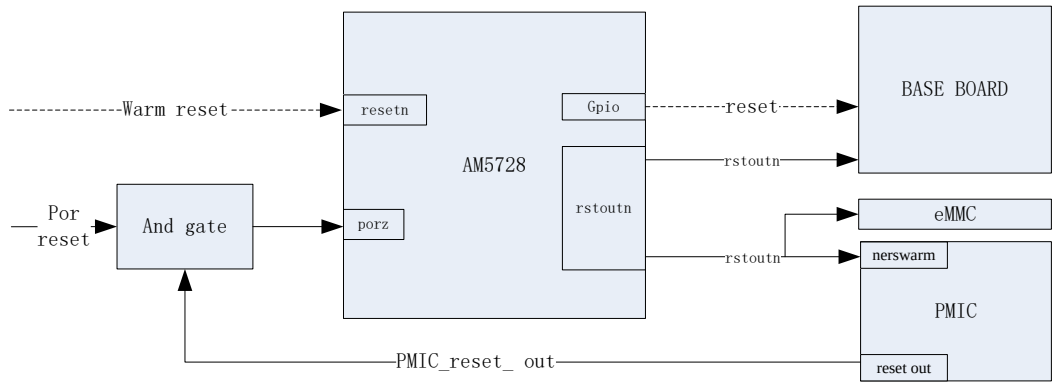
3.2.4. Reset design

The SOM board can be reset by the base board with a reset input signal.
The SOM board can reset the base board with a reset output signal.
The peripheral devices can reset with cpu at the same time or controlled by cpu gpio.

There is a device erratum in all of the AM572x devices that prevents use of RESETn independent from PORz. The workaround is to generate PORz whenever a device reset occurs even if it is from an internal initiator. This is accomplished through cooperation with the PMIC paired with the AM572x device. The RSTOUTn output from the AM572x device is connected to the NRESWARM input of the PMIC. This initiates a re-start that drives RESET_OUT low and resets all voltages to their initial values. Since RESET_OUT from the PMIC is connected to PORz in the AM572x device, a hard reset is forced on the SOC that meets the needs of the erratum workaround.
Please reference the document “AM572x Errata” to get more information.
The reset architecture is as below:



The power sequence of reset as below:

Figure 13 shows the warm reset sequence of TPS6590377ZWSR in the case that all resources are turned off. If any resource is on when NRESWARM is asserted, the resource remains on.

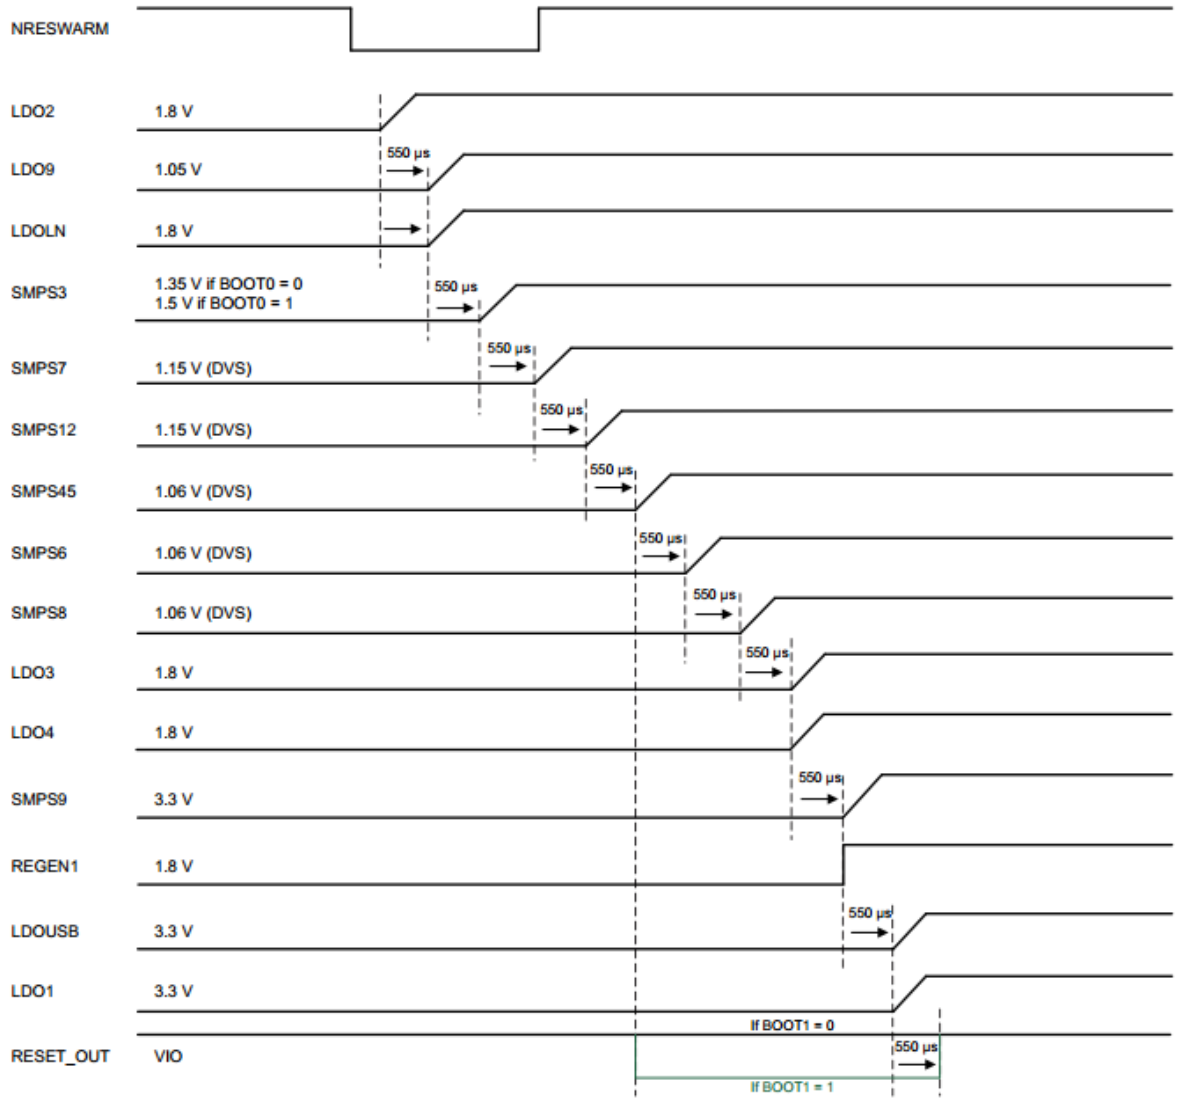


Figure 13. Warm Reset Sequence of TPS6590377ZWSR

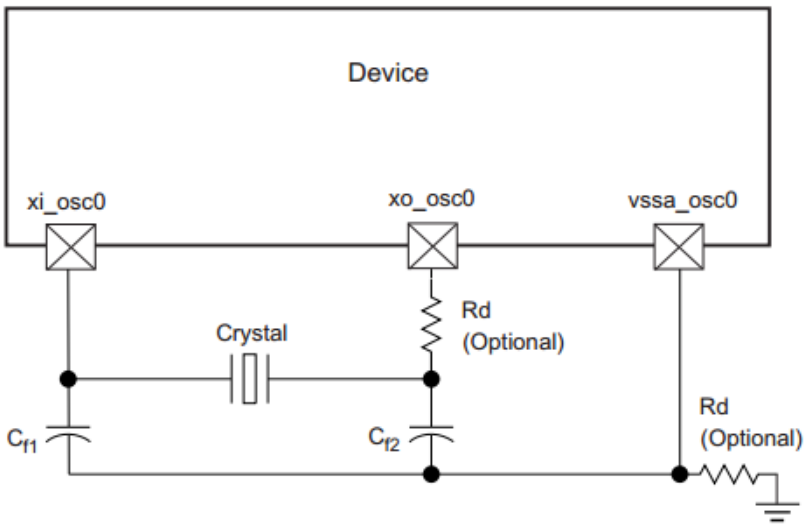
3.2.5. Clock Design

AM5728 operation requires the follow clock:

The 32KHZ ferquency for low frequency operation can be supplied by on chip divider +mux(FUNC_32K_CLK),external input clock(32KHZ) is not used.

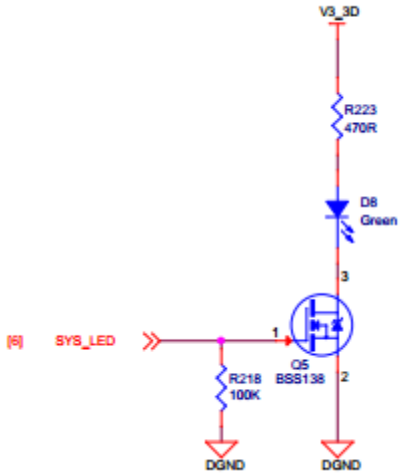
A crystal clock is connected to OSC0 as the source of the internal system clock(SYS_CLK1). The frequency is 20M as TI recommend.



A crystal clock is connected to OSC1 as the source of the internal system clock(SYS_CLK2) The frequency is 22.5792M as TI recommend.

3.2.6. LED Design

A LED is controlled by the powergood signal of PMIC to indicate the power status of the AM5728.
A LED is controled by a gpio (low level default),the function is defined by SW.
The reference circuit as below :



3.2.7. RTC Design

RTC mode is not supported in the family of devices,a external RTC need to add on the base board.

3.2.8. JTAG Design

To minimize the size of the SOM board,test points are used for the JATG.
We need to connect test points to a cable if the JTAG interface is used during the development.

3.2.9. UART/CAN/I2C Design

All the I2C interfaces have been pulled up on the SOM board,UART and CAN interfaces need to pull up on the base board.

3.2.10. Interface Design

All the interfaces need to connect to the connectors directly,ESD conponents are not needed,
Pull up /pull down resistances are not needed expect for the special use.
All the output clocks need to add the RC circuits to avoid the signal reflect and EMI.

4. Impedance Control

The impedance requirement as below.

Interface	Single Ended Impedance	Differential Impedance	Margin
DDR	50	100	+-10%
USB	45	90	+-10%
SATA	50	100	+-10%
MMC	50		+-10%
PCIe	50	100	+-10%
RGMII	50		+-10%
LCD	50		+-10%
GPMC	50		+-10%

6. Resource Allocation

The resource requirements of PRD have been meeted.

6.1.1. Memory Map

The system memory mapping is flexible, with two levels of granularity for target address space allocation:
• L1: The four quarters are labeled Q0, Q1, Q2, and Q3. Each quarter corresponds to a 1-GB address space (the total low-address space is 4 GB, 32-bit). The CPU extended address range is labeled as high memory (Q8 – Q15) and provides a total of 8 GB.
• L2: Each quarter is divided into eight blocks of 32 MB, with target spaces mapped in the blocks.

Item	Address space	Description
Boot	0x4000 0000 - 0x400F FFFF	When booting from the on-chip ROM with the appropriate external sys_boot pin configuration, the lowest 1-MiB memory space [0x0000 0000 - 0x000F FFFF] is redirected to the on-chip boot ROM address space [0x4000 0000 - 0x400F FFFF]
GPMC	Q0 0x00000000 - 0x1FFFFFFF	
EMIF1/EMIF2 CS0	Q2 0x80000000 - 0xBFFFFFFF	
EMIF1/EMIF2 CS0	Q3 0xC0000000–0xFFFFFFFF	
QSPI	Q1 0x5C000000–0x5FFFFFFF	

6.1.2. I2C Address Allocation

IC	I2C address (7bit)	I2C address(R/W)
TPS659037(I2C1)	0x58 0x59 0x5A 0x5B	Power registers 0XB1/0XB0 Interfaces and auxiliaries 0XB3/0XB2 Trimming and test 0XB5/0XB4 OTP 0XB7/0XB6
